# Agenda

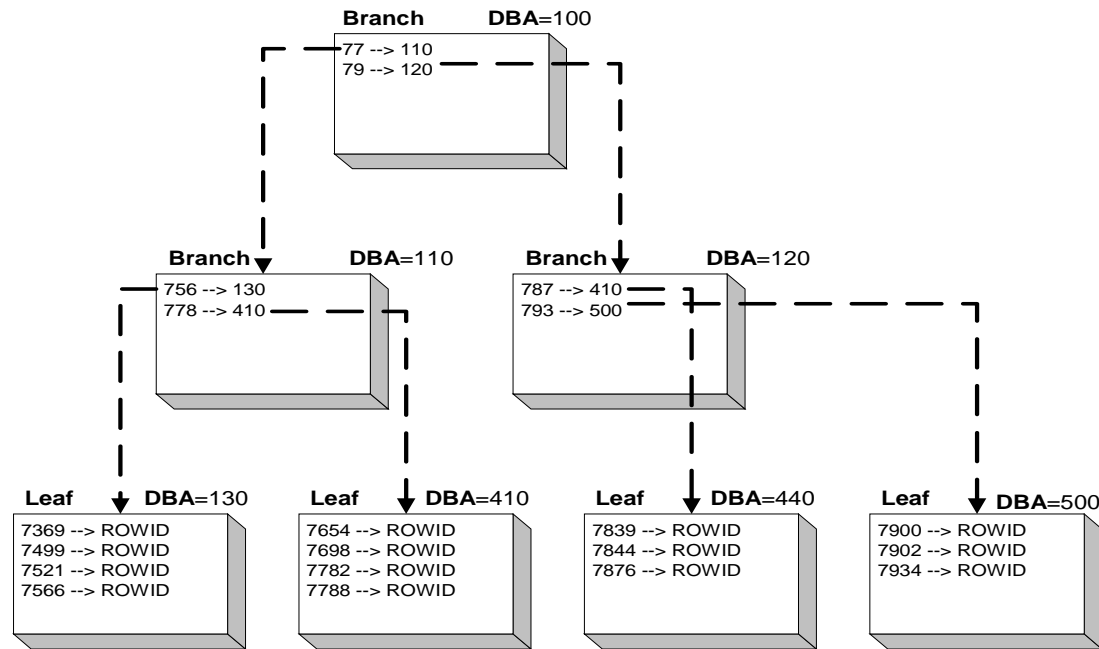

- Index Monitoring
  - Introduced in Oracle9i
- Things I've Heard...
- Index Clustering Factor
  - Relationship between index and table data blocks
- Oracle10g New Tablespace Features
  - Automatic Space Management
- Case Study

# Indexes

# Indexes

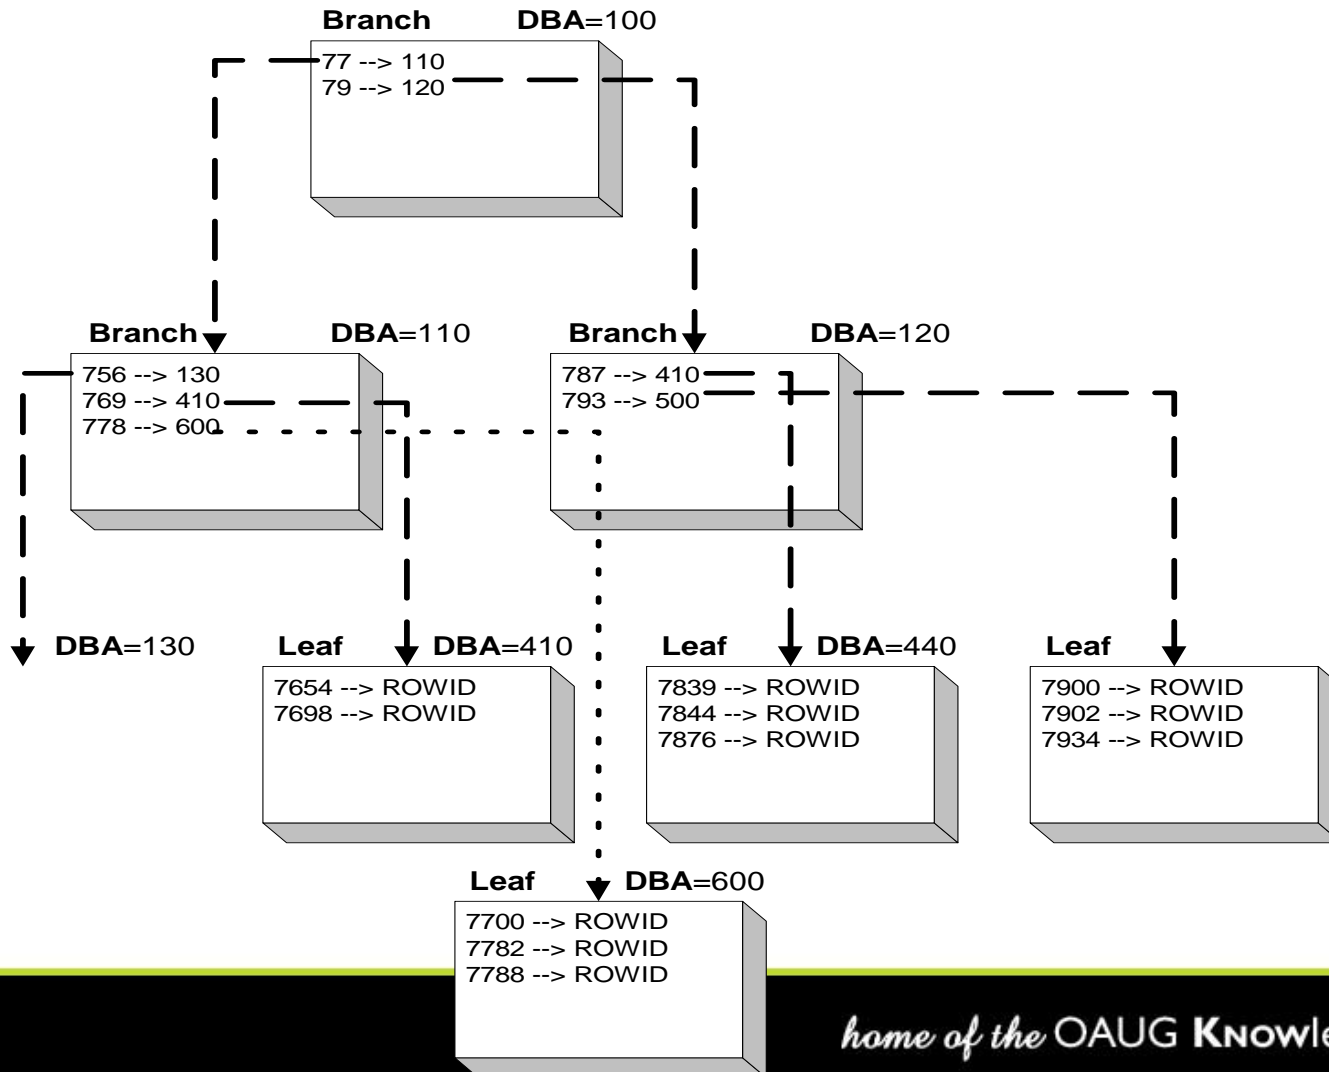

- Indexes:
  - Fast path to rows
  - Insures uniqueness
  - Oracle can use them when processing an Order By
  - NOT always the fastest method
  - Not used with any Oracle function
  - Coding style definitely affects Index usage

# B\*Tree Index Structure

# B\*Tree Index Split

# B\*Tree Index

- Reorganize Indexes
  - Fills leaf blocks to PCTFREE
  - Performance of fast full scans and range scans increases

# Index Monitoring

- Oracle9+ can monitor Index Usage
  - SQL> alter index <index name> MONITORING USAGE
  - SQL> alter index <index name> NOMONITORING USAGE

View: SYS.V\$OBJECT\_USAGE

# Things I've Heard

- Things I've Heard...
  - SQL with Histograms not working correctly
  - SQL with Different Explain Plans for no apparent reason
  - Try COMPATIBLE setting
    - Set to 9.2.0.0.0
    - ALTER SESSION SET COMPATIBLE = 9.2.0.0.0
    - INIT.ora sessing

# Index Clustering Factor

- The relationship of how many data blocks each leaf block points to
- Collected by CBO
- Lower the clustering factor – more the data is in order by indexed column
- Design indexes/data order around most-used queries/most important queries

# Index Clustering Factor

# Index Clustering Factor

# Automatic Space Storage Management

- Replaces Free lists and free list groups
- Ignores PCTUSED
- Uses a bitmap in the segment header to track available space
  - Holds less extent pointers (chains more quickly)

# Automatic Space Storage Management

- Only available with Locally-Managed TS
  - Oracle9v2+
  - AUTO – uses Automatic Space Storage Mngt
  - Manual – uses freelists (existing technology)

```
CREATE TABLESPACE my_tablespace DATAFILE '/oracle/data/myts01.dbf'
SIZE 500M
EXTENT MANAGEMENT LOCAL
SEGMENT SPACE MANAGEMENT AUTO;
```

# Automatic Space Storage Management

- Different Segment Header Info
  - No changes in Cache Layer, Map Header
  - Extent Table holds these limits:
    - 2K – 151 Extents (down from 121...)
    - 8K – 307 Extents (down from 496)
    - Etc
  - Low/High Water Marks
    - Low HWM – all blocks below are formatted
    - High HWM – all blocks above are unformatted
    - Between: Oracle checks block status bitmap flag

# Automatic Space Storage Management

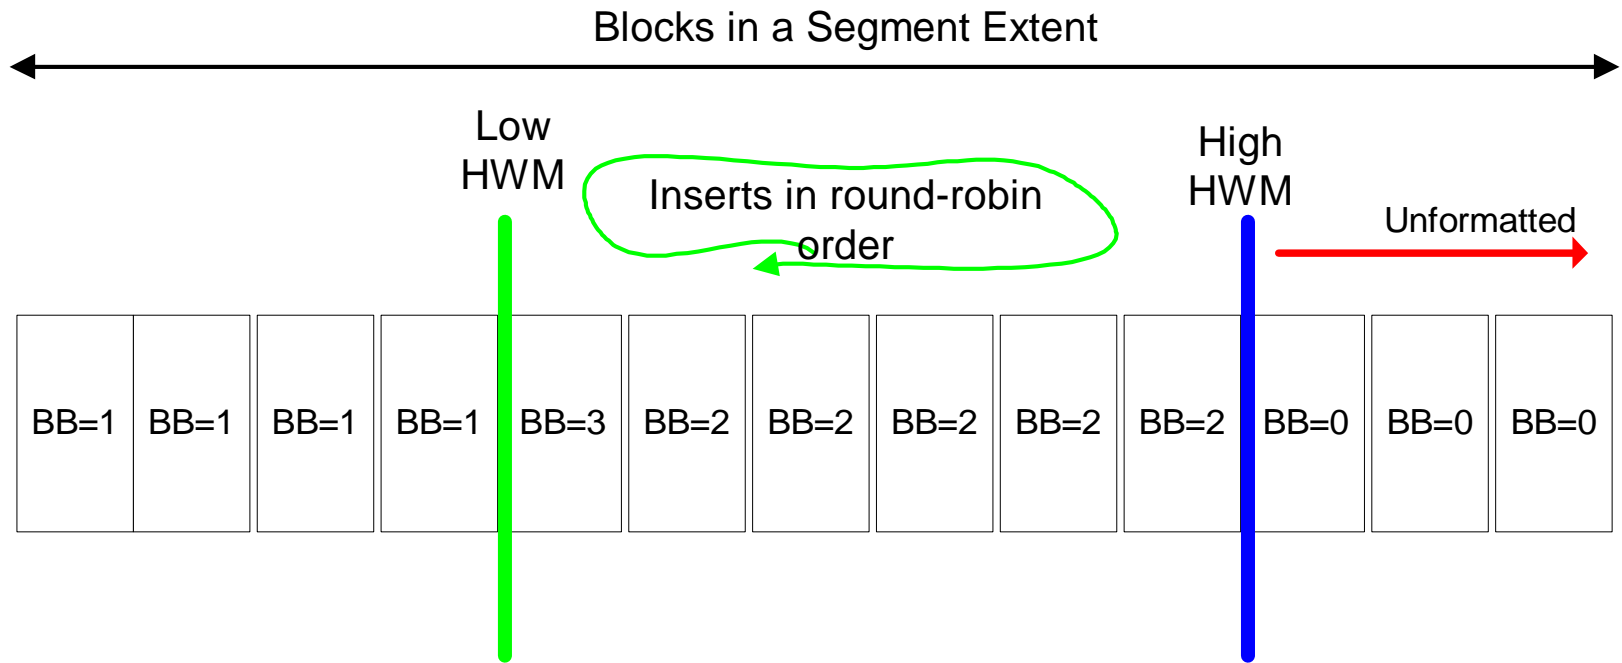

- **Bitmap Blocks**
  - Stored in separate blocks as part of the segment header
  - Tracks PCTFREE and formatted/unformatted blocks
  - Tracks total free space in the block (not just what is available for inserts)

# Automatic Space Storage Management

- 1 nibble (bit) per data block in the segment
  - 0 = unformatted
  - 1 = Full (met PCTFREE)
  - 2 = 0 – 25% free
  - 3 = 25 – 50% free
  - 4 = 50 – 75% free
  - 5 = 75 – 100% free
- Updated as blocks cross thresholds

# Automatic Space Storage Management

- How it works:

# Automatic Space Storage Management

- What it is good for:
  - Apps with lots of concurrent inserts
  - RAC (intended use)
  - Other 10g features
- What it is NOT good for:
  - Space not well used
  - Space can be come lost
    - Needs DBA Attention/monitoring
    - `FIX_SEGMENT_STATUS`
  - Redo generation is high
  - Can give indexes a high clustering factor!

# Index\_Info.sql

sql <No name> | sql <No name>

```

1 SELECT i.table_name, i.index_name, t.num_rows, t.blocks, i.avg_data_blocks_per_key,
2 i.avg_leaf_blocks_per_key, i.clustering_factor,
3 to_char(o.created, 'MM/DD/YYYY HH24:MI:SSSS') Created
4 from user_indexes i, user_objects o, user_tables t
5 where i.index_name = o.object_name
6       and i.table_name = t.table_name
7 order by 1;

```

# Case Study

- Large ERP Application
  - 4 CPU IBM P Series
  - 12GB Memory
    - SGA set at 3GB
    - Shared Pool 300MB
  - AIX 5.2 64bit OS
  - Major performance problems when migrating their ERP from 9.2.0.5 to 10.2.0.2
    - JD Edwards One World – No changes/upgrades – just rehosting

# Case Study

- Large ERP Application
  - Metalink & 2 Consultants of little help
  - Weeks worth of stats pack reports
    - I/O and explain plans the same
  - Histograms changed
  - “No one could tell me anything...”

# Case Study

- Solution
  - Upped the memory
    - Added 12DB Memory
    - SGA to 10GB
    - Shared Pool to 1.8GB
  - Adding 4 more CPUs solved the problem
    - It appears our machine could not handle the same I/O as it did with Oracle9i
  - Oracle finally said – after the problem was solved - that the 10g kernel code had grown enough that our 4 CPU system could not handle it

# What have we learned?

- Index Monitoring
  - Introduced in Oracle9i
- Index Clustering Factor
  - Relationship between index and table data blocks
- Things I've Heard...
- Oracle10g New Tablespace Features
  - Automatic Space Management
- Case Study
  - ERP Application
- Lets do the book draw!!!
